Key Dates

Distribution of Pinewood Derby Kins Weigh in and Tech impection Race Day (receive)

9AM to 1PM 6PM to 9PM

Here are some tips that I got off the Internet and from past winners. This is broken into two sections, basic techniques and advance techniques.

Basic Techniques

Planning and cutting

Sketch a design and cut out the design. Although you would think acrodynamics would be a major consideration, in actually racing this has proven not be the case. Let your scout be creative in their design and don't worry whether it is streamline or not.

Planning for Weight.

Your finished wood block along with the, wheels, asdes and trim will not usually weigh much over 2.5 onnees/71 grams while the finished car is allowed to weigh in up to 5.0 conces/141.75 grams. The weight of your car overcoming friction is what will allow to you to win over other cars. You must make gravity weak for you. Your car must overcome both breaksway friction it will do this by being as heavy as allowed while presenting the smallest profile to the air-stream. In Pack 43 weight is added at the Tech Inspection but you must plan where you want the weight. At the inspection weight will be added using a drill press and 1 1/2ox weights. There is an advantage in placing the weight in the back. The front wheels perform the function of guiding or steering and the less weight on these whosh the easier the car corrects itself when it strikes the guide strip. Fewer and shorter contacts with the guide strip means a faster car.

Sending and amortising.

Sanding the wood body will eliminate any of the saw blade marks as well as any small blentishes in the wood surface. If you have access to a motorized best-disc sander your work will be quickly done but fix most of an about of sandamper and a sanding block will do just fine. Start by using a 120-grit paper and wood or rubber block on the filter and rough portions of the wood our body. Gently amouth the edges and corners of the car while sating a little more pressure on the flat areas. When you have the wood amouthed switch to the 400-grit paper, it will provide an excellent surface for your final finish, DO NOT WET-SAND UNPAINTED WOOD.

Printing and finishes.

The bare wood surface will act much like a sponge when your paint is first applied and it will take several coats of paint to scal and finish the wood. A better approach is to apply a wood sanding scaler or primer to the wood. This acts like a primer cost for the wood and provides a good base to apply the color finish paint. Prepare a phone to paint your car that will be cut of the house while you are painting and out of the reach of young children while your car is drying. You may either paint one side at a time waiting between coats or suspend the cur on a string with a only in the side slot and paint all of it. Brush or spray the sanding scaler on the cur with a complete coat and wait for it to thoroughly day. After it is day, sand it with 400 grit wet or day sandpaper. You will find that the finish is smoother if you are a wet-sanding process. Wet the paper and the painted car body. Lightly sand until the sanding-scaler is

smooth but not through the scaler to the wood. You are now ready for the finish color coats of paint. The best and smoothest finishes will be had with spray paint but brush-on paint will not effect the overall speed of the car either. Use fast drying enamels and avoid using different brands on top of each other. If you get a rea in the paint, let it dry and send it smooth. Re-cost it later. You can achieve a very, very smooth finish if you wet-sand between costs with 600 grit wet-or-dry sandpaper. If you are going to apply decals and detail work now is time to do this type of work. If you are careful, you can apply a clear cost of finish over the decals to send them. Don't use too much elem-tons at a time or you'll wrinkle the decals.

Wheel Work.

Next to the weight of the car the wheels are the most important element in the car. The biggest problem is that there is not a great deal that you can legally do with them. You must insure that the wheels roll smoothly, is a simight line and roll very easily. The wheels included with kits manufactured through 1998 have a better quality wheel then that of previous kits. Kits produced in the 1999 race year were very inconsistent. Even still, there are things to check and fax on each of the wheels. First, the wheels must be perfectly round. Some molds may produce stightly out-of-round wheels that are slower than others may. To check for this put the wheel on an aide and spin it. It should turn with the outside surface at a single reference point never varying. The run-out or the wheel movement along the sale axis should also be minimal. If you suspect the wheel is out-of-round discard it and buy just the axio-wheel kit at your Scout supply outlet. There isn't much you can do to correct a had wheel. The wheels are all produced from a mold set and will all vary to some degree. Check the wheel for burrs on the minning surface of the tire and hob areas. These need to be freed of any extra plastic residue or molding marks. Most Packs and council most remains the racers to do minimal work on the wheel surface. This means that the outside wheel surface can be surded or filed to make it that across the bottom of the "tire". To perform this work you may use either a very small machine screw or nail about 3 inches long to stack all 4 wheels onto and chock them in to a drill motor. Using a fine flat will file, turn the drill on and at an angle to the rotating wheels; apply Very light pressure to the wheel surface touching at least two wheels at a time. Insure you don't create a rounded wheel surface that may be illegal. If the wheel is noticeably altered it will be rejected at the weigh-in.

Arte Pelishing

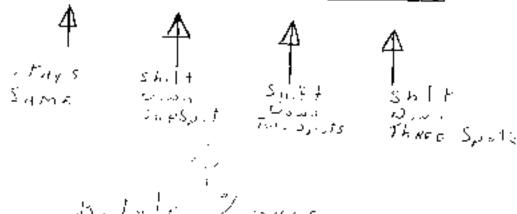

The 'nail' type ardes that come in the Pinewood derby kit must be used in the construction of your of your car. These axies provide no bearing surface so there is friction between the plastic wheel surface and the metal axie. Since this friction reduces speed we need to trinsruize the contact surface area, make the surfaces smooth and inbricate the maxing surfaces. It is equally against the rules to machine the plastic wheel and these procedures oscally require a lathe or other tooks not typically available to a Cub Scoot. That still leaves the exic open to "play with". The following angrestions are things you can do with simple hand tools to improve the performance of the udes. First, the heads of the nails used as axies in the kit will often have a mold or casting mark in two places just where the head attaches to the short the nail. Remove this web of metal with a file being careful not to gauge or exact the reming surface of the shaft. This will prevent the axis from grinding the plastic hab area and dowing down your car. This is usually best done with the acte chucked up in a drill press or drill motor that is assessed into a stable positions. Polishing the axis can be finished to a high hoster by following the steps detailed here. Pirst, mount the axis: in drill motor chuck exposing the head and the first 3/4" of the axie. Secure the drill so that it descrit move. Now call a tricce of 400-600 grit wat in thy sandpaper to a strip approximately 16" wide and 4 to 6 inches in length. Wet the surface of the sand paper with water or light machine oil, start the stall and loop the sandpaper over the axis and pull. the paper back and forth like a since polish cloth. Work the paper until the metal is smooth in the wheel running mon. (next to the head of the axie). This usually takes about a minute for each axie. Now, using either punice pasts to metal polish in a soft cloth (like a tex-shirt), start the drill again and press the cloth and polish compound hate the axle with a slight provement back and forth. This will also take about a minute. The finished axle will be very emooth and bright in appearance.

Labrication

The type of inhelection is usually restricted at most races to dry inhelect graphite or white Tellon labe. They provide very this plating of microscopic spheres that greatly reduce rolling friction. Plain graphite is available in hardware places and some variety stores. When installing your wheels fill the axis hole of the wheel while capping the other pide. Gently push the axis through the wheel. Do this several times and spin the wheel to help distribute the graphite through the running surface. A good test of the wheel, ande and the initiation is a spin test. While holding the wheel in the axis in a horizontal position spin the wheel with a flick of your funger. It should spin freely, then slowly coming to a stop after 20 to 30 seconds. If it didn't spin that long take a close at your wheel Generate, sade finish and habitention. Correct the problems than test them again.

SANTA CLARA COUNTY COUNCIL, BSA PIONEER DISTRICT (REVISED 2001) CAR BUILDING RULES

THE KIT- The car shat he built from the official "Cub Scout Grand Prix Pinewood Derby Kit." All cars must compty with the racing specifications and building instructions furnished with the official kit. The Kit is one piece car body with plated nails for wheel axles and wide tread wheels, designated as the GRAND PRIX PINEWOOD DERBY KIT. Only official BSA wheels and axles may be used as replacements. Unofficial kits will not be accepted. The "PineCar" Pre-Cut Design budies WILL, NOT, be allowed to enter the District Race.

THE CAR BODY. This is a Pinewood Derby race for wooden cars. Molded metal hodies over wooden frames are beyond most parent/son team and are therefore not acceptable. This tule does not prevent adding metal to the care to increase its weight

WHEELS AND ANLES—All cars must have 4 (four) wheels. THE SHAPE AND FORM OF THE WHEELS CANNOT BE MODIFIED OR RESHAPED, however wheels may be saided to remove molding burrs. The official kit provides a nail for the axle THE WHEELS AXLES MUST BE INSURTED IN THE PRE-CUT GROOVES THAT ARE ALREADY CUT IN THE CAR BODY. The wheel base (distance between the axles) must not be changed. Wheel bearings, washers, bushings, axle sleeves, wafering, and wheel covers are prohibited. All four wheels MUST be in contact with a flat surface when the car is placed on it.

PHYSICAL DIMENSIONS- Overall dimensions must not exceed the specifications for the kit-3" wide by 7" long by 3, high. In addition, the distance between the wheels must be grater than 1.7/8", inside measurement. No part of the car can extend beyond the starting post and the from of the car must be no higher than 1/2" where it contacts the starting post.

WEIGHT- The car weight shall not exceed 5.0 nunces (141.7 grams). No loose material of any kind is permitted in or on the car. The car may be hollowed out and built up to the maximum weight by the addition of solid materials such as wood or metal provided it is securely attached or built into the body chassis. The weight MUST NOT be taped on. No liquid weights are permitted inside or attached to the outside of the car body. No weights may be added after the car has raced in the Pack race.

HINT The cars run better when the weight is added (to the maximum) in the center of the ear chassis. Adding weight at the chassis and causes the car to bounce (cars will be disqualified if they jump out of their lane three (3) times).

<u>SPRINGS</u>- The car shall not run on any type of springs. The car must be freewheeling with no starting devices.

LUBRICATION- The wheels and axles may be lubricated with WHITE LUBE OR DRY POWDERED GRAPHITE. No additional lubricant may be added after the district race starts. If wheel or axle repairs are necessary during the race, the replacement part may be re-lubricated under the supervision of a race official.

TRACK CLEARANCE. Track clearance is specified at 3/8" even thought the lane strips are only 1/4" high. The extra clearance is to allow the car to go from the sloped portion of the tract to the flat portion without dragging.

REGISTRATION AND INSPECTION

All cars must be registered, inspected, and the fee paid at the weigh-in in order to run in the race. NO EXCEPTIONS Cars that are not registered and inspected at this time will not be allowed to race.

Only the First and Second place cars for Tiger Cubs and the First and Second place cars for Cub Scouts/ Webelos Scouts from the Pack race will be allowed to register for the district race (or a Third place alternate if either of the first two cars are disqualified, for example if it is built from and unofficial car kit or has unofficial wheels). A Pack Race Official is required to impound the cars at the completion of the Pack Race and bring them to the registration and inspection. This is to prevent any modification to the cars between the Pack and District races. The car drivers and their parents should be at the registration and inspection in case the car is too heavy and weight must be removed.

CHECK-IN AND RACING

The Tiger Cub or Cub Scout is expected to race their car. If due to illness, they are unable to race their car, another child may drive their car with the approval of the District Race Committee.
